Gyuchoon Cho

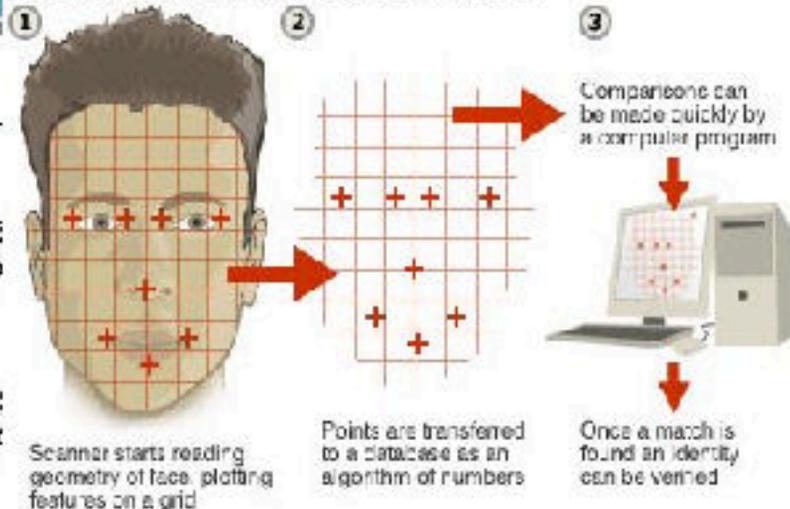

[Face Detection]

- Face detection is a computer technology which determines the location and size of human faces in arbitrary images. (*Wikipedia*)
- Nowadays, face detection technology is ubiquitous in the world.
 - Surveillance cameras - with suspect detection.
 - Fuji film's face-focusing, Sony's smile shutter, Apple iPhoto.
 - System log on with face recognition

[Examples of Face Detection]

Report

[Face Detection Techniques]

[Face Detection tasks]

face detection can be regarded as a specific case of

- ❑ Object - Class detection
The task is to find the locations and size of all objects in an image that belong to a given class. Examples include upper torsos, pedestrians, and cars.
- ❑ Face Localization
The task is to find the locations and size of a known number of faces.

[Face Localization]

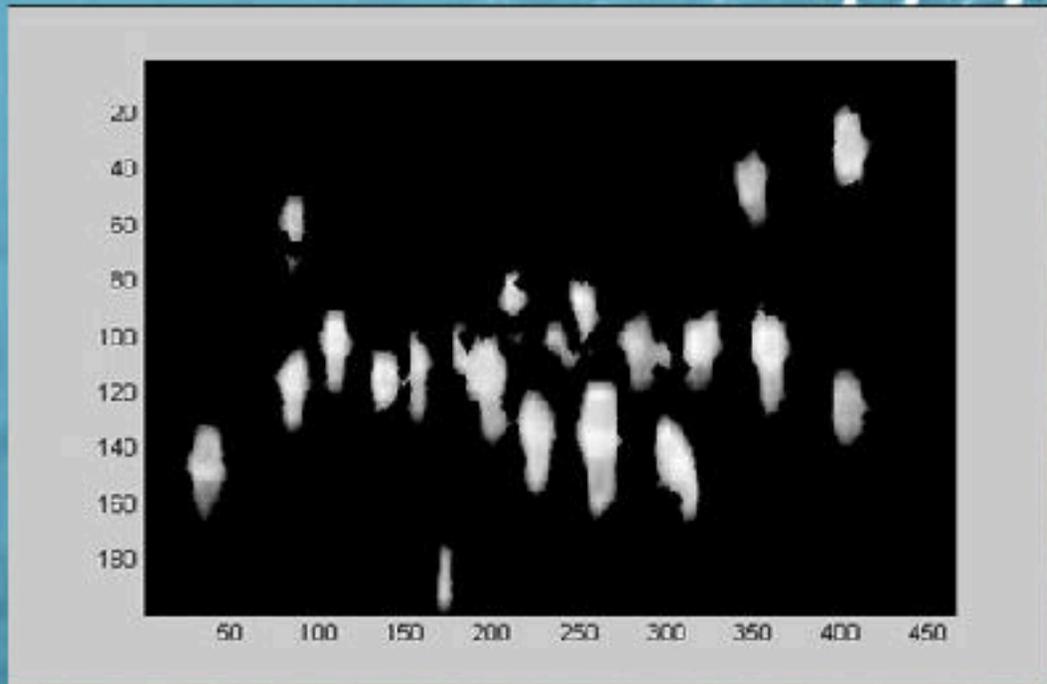

Probable Face Pixels

Lighter pixels mean higher probability of being a face pixel.

Next

[Face Localization]

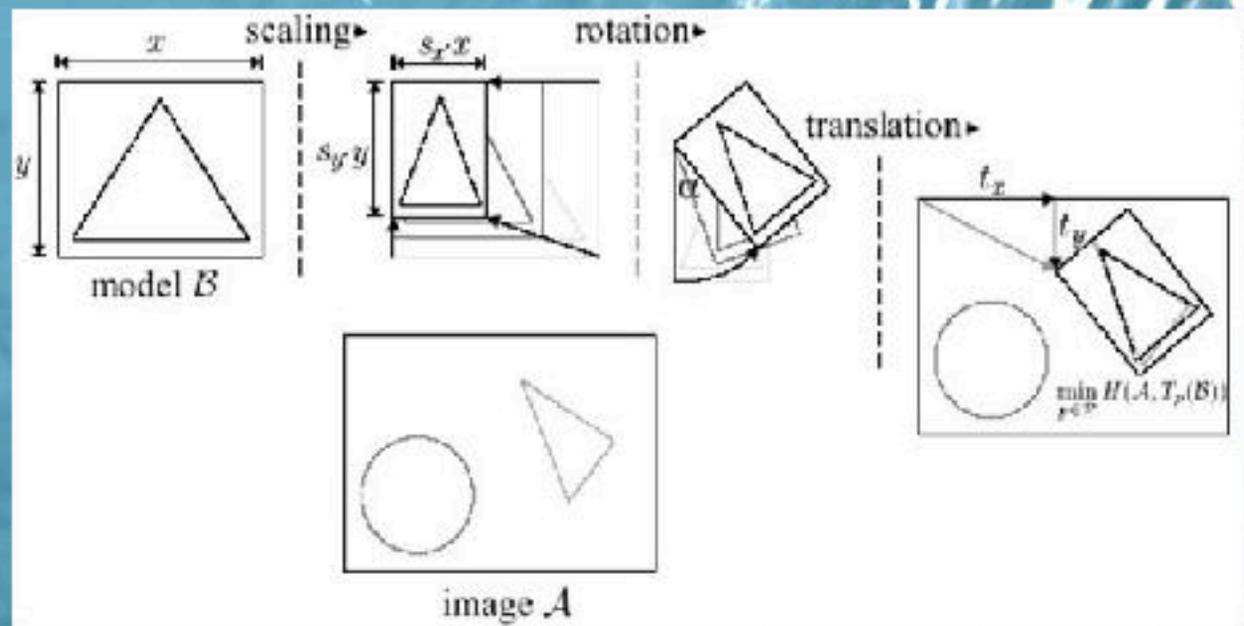

Color Segmented Mask

Mask produced from thresholding the filtered probability image.

Next

[Object Class Detection]

- Model fitting by scaling, translation and rotation.
- ex) Hausdorff Distance is a specific case of Object Class Detection

[Software Development Kits]

□ OpenCV

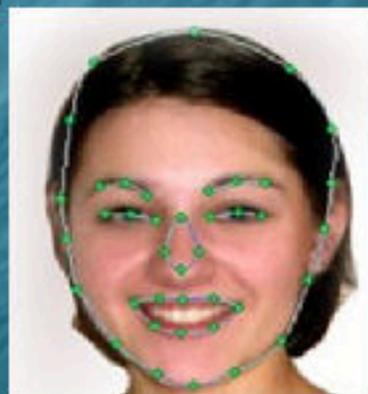

OpenCV is a computer vision library originally developed by Intel. The library is cross-platform, and runs on Windows, Mac OS X, Linux, VCRT (Real-Time OS on Smart camera) and other embedded devices. It focuses mainly on real-time image processing

□ VeriLook

VeriLook SDK is based on the VeriLook PC-based face recognition technology and is intended for biometric systems developers and integrators. It allows rapid development of biometric applications using functions from the VeriLook library, which ensure high reliability of the face identification. VeriLook facial recognition software is now available for Mac OS X

□ Luxand Face SDK

- Detection of 40 facial feature points such as eyes, mouth, nose, and face.
- Detection time: 0.9 seconds
- up to 5,000 faces per second

[System Environment]

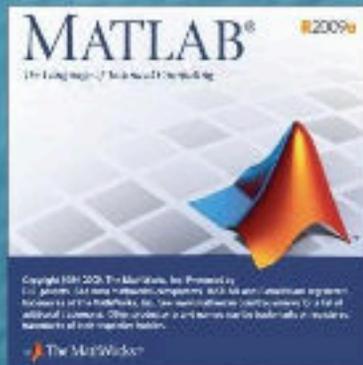

❑ MATLAB R2009a

❑ Codegear RAD studio. (Delphi 2009)

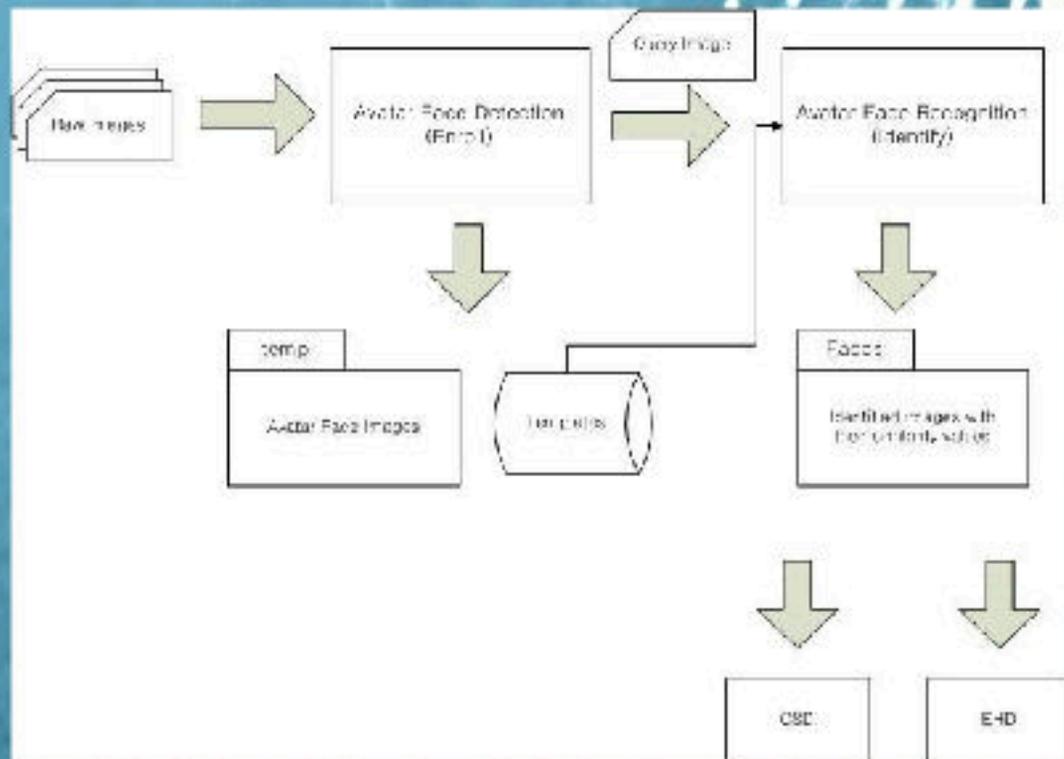

❑ Rapid Application Development Programming Tool

❑ Verilook 4.0

❑ SQL lite

[System Work Flow]

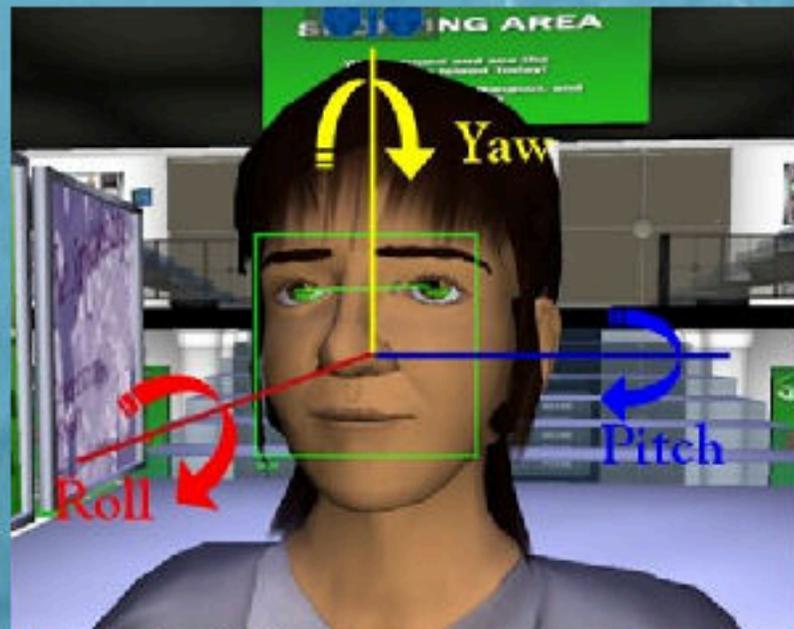

[Algorithm]

- ❑ Advanced face localization
 - ❑ The algorithm implements advanced face localization, enrollment and matching using robust digital image processing algorithms.
- ❑ Fast identification speed - 100,000 faces per second
 - ❑ Tested on a PC with Intel Core 2 processor running at 2.66 GHz and 640 × 480 pixels of image

[Roll, Pitch and Yaw #1]

- Head roll (tilt) - ± 180 degrees (configurable);
 ± 15 degrees recommended
- Head pitch (nod) - ± 15 degrees from frontal position;
- Head yaw (bobble) - ± 15 degrees from frontal position;

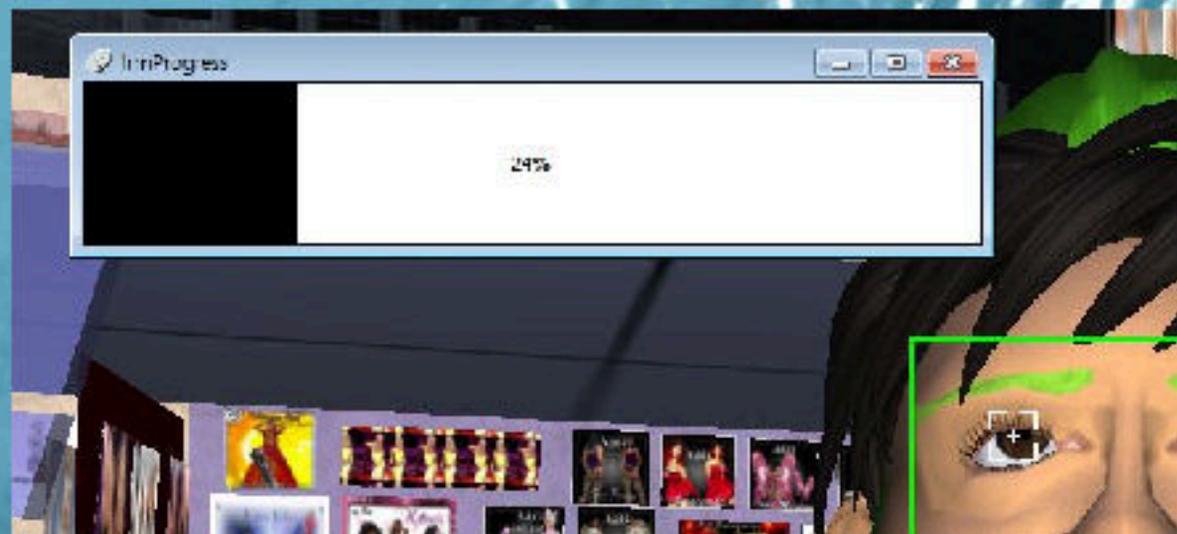

[Roll, Pitch and Yaw #2]

	Maximized Template Size	Medium Template Size	Minimum Template Size
Detection time for all faces in a frame ($\pm 15^\circ$ head roll tolerance)			10 milliseconds
Detection time for all faces in a frame ($\pm 180^\circ$ head roll tolerance)			13.5 milliseconds
Single face template extraction time (1) (milliseconds)	111	62	31
Matching speed (2) (face records per second)	24,000	44,000	200,000
Template size in database (3) (bytes)	20,440	11,368	2,296

[Enrollment]

[Color Structure Descriptor]

- Main functionality of this descriptor is **image to image** matching
 - it expresses local color structure in an image by use of a structuring element that is comprised of several images sample.
- The CSD is a generalization of the color histogram that captures some spatial characteristics of the color distribution in an image.
 - It is defined in the HMMD color space using non-uniform color quantization to between 32-256 colors.

[HMMD]

max value=maximum value from input r, g, b values;
 min value=minimum value from input r, g, b values;
 diff=max value-min value;
 sum=(max+min)/2; and

hue=(g-b)/(max-min)*60, if (r=max ∧ (g-b) ≥ 0)
 hue=(g-b)/(max-min)*60+360, if (r=max ∧ (g-b) < 0)
 hue=(2.0+(b-r))/(max-min)*60, if (g=max)
 hue=(4.0+(r-g))/(max-min)*60, if (b=max)
 hue= 0, if max=min.

CSD result using 64 bins

[Edge Histogram Descriptor]

- The image array is divided into 4x4 subimages.
- The edges in each image-block is categorized into one of the following six types:
vertical, horizontal, 45^\pm diagonal, 135^\pm diagonal, nondirectional edge and no-edge.
- A 5-bin edge histogram of each subimage can be obtained.
- Each bin value is normalized by the total number of image-blocks in the subimage.
- The normalized bin values are nonlinearly quantized.
